# Manual of
Bunker Windows.

Made by: AlexWesker.

The next manual pretends to guide you on the correct form of use of the app "Bunker Windows" and explain you, above, the behaviour.

When you run the app on the first time, you will see some similar at the next image:

This means that are prepare the differents tasks to create a backup of your Operating System before you will apply the changes that will make the app. Then, you will see some similar to the next picture:
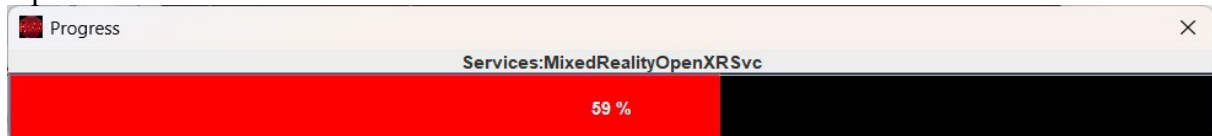

A progress dialog, show you, on the own, the progress on create the backup. The backup will be created on the installation directory on the "initConf" dir, and contains the differents files to, on the case, restore the system at the point you run the Bunker, on a backup way. To clarify, IS IMPORTANT DONT DELETE THIS DIR, and, on the case, save this dir on a USB if this dir will be removed accidentally or similar, to use, again, on a backup way.

When the backup creation was finished, will be appears a dialog showing you that the process have been finished succesfully.

This step, if you dont delete the dir mentioned, only will be executed once time on the life time of application on your dev.

Then, you can see the app:

I will explained the different points:

1) InitBunker: Initializing the process to transform your dev with windows on Bunker.
   Note: Is important, read the point 11 and the final recommendations for understand one thing. Read the manual completly for understand how to protect your privacy on the correct form.

2) Restore: Restore (with the backup made as you did read before), the PC on the previous configuration.

3) Habilitate Microphone: Habilitate the microphone, include on the case you have the Windows, include with the Bunker working (on other words, the microphone will works saving your privacity).

4) Deshabilitate Microphone: Deshabilitate the microphone.

5) Habilitate Cam: Habilitate the camera, include on the case you have the Windows, include with the Bunker working (on other words, the camera will works saving your privacity).

6) Deshabilitate Camera: Deshabilitate the camera.

7) Habilitate Dev: On some cases, the Bunker stopping some characteristics of Windows, on this case, you are habilitating some services required for make up new devices on your PC. Is important if you will connect new devices after of apply the changes on Windows. Other alternative, is push the button Restore, connect the device, and then apply the changes again of the Bunker (1).

8) Deshabilitate Dev: Deshabilitate the services (the idea: habilitate dev, connect the new device, and then when you use the device if isnt recognized, deshabilitate these services).

9) Habilitate Installer: Habilitate the services needes on the case to install some apps after the Bunker changes. (The idea is: habilitate services, install the app you need, and then deshabilitate these services again). Other form is: Restore – install the app – apply Bunker changes again.

10) Deshabilitate Installer: Deshabilitate the installer.

11) Use a VPN connection for Internet: To use a VPN (based originally on Tor, with little modifications to keep the privacity more secure).
    On this point, when you press this button, will appears the next:

And you will connect on a version of Tor, with a little modifications for keep your privacity more secure that using a convencional Tor.

On this point IS IMPORTANT THAT THE DIALOG ONLY CAN CLOSE ON "STOP VPN" BUTTON, when you will click this button, you will stop the VPN, on other words, you need the dialog open for use the VPN (this is optative, ever you can use your own VPN but is recommended). With this, YOU WILL NEED CONFIGURE YOUR BROWSER TO ACCEPT THE CONNECTIONS OF THIS VPN (search information on Internet about "how to change the settings of my navigator).

These VPN use the next direction (for configurate your browser): 127.0.0.1:6666

SEE THE FINAL RECOMMENDATIONS, NEXT POINT.

FINAL RECOMMENDATIONS

This app, provided you some tools for keep your privacity inside your PC, but the Internet connections ever can be seen for your Intenet providers. To keep your Internet traffic more secure and private, is recommended use a VPN or similar and, configure your system proxy on your typical browser and Windows. You can encounter different information about it on Internet, depending of the browser you use typically.

If you use the VPN included on the app, you will need take the next information, the proxy works on 127.0.0.1:6666.

You can too launch the program of the VPN accessing at the installation directory, on the filesAux dir, the program "vpnModT.exe", launch this program on a terminal using the next command:

vpnModT.exe –HTTPTunnelPort <numPort>

And then configure your Windows proxy settings (Configuration → Internet → Proxy; and enter the next proxy 127.0.0.1 as IP and <numPort> as port used on the last launch).

By the last, dont forget that YOU NEED CONFIGURATE YOUR BROWSER TOO, on the similar form you configure the Windows proxy as the later phrase and on the same form. Search information about your browser on Internet and how to make it.

But, probably, a good practice will be to use TorBrowser as navigator, but the OnionNetwork is being compromised, for this is more secure use the exe on this app.

Enjoy!
